About Deep Tissue Heat Laser

About Deep Tissue Laser Therapy:

Laser therapy is a non-invasive technique to help reduce pain and inflammation. Laser therapy can be safely used as an adjunct or replacement for pharmaceutical drugs. This pain relief treatment is FDA cleared and enables patients to have an alternative to drugs and surgery.

Deep Tissue Laser Therapy accelerates your body's own natural healing process through photo-bio-stimulation. Laser therapy provides concrete benefits to your patients and your practice. Laser therapy is effective in treating chronic conditions, acute conditions and post surgical pain.

Clinical Benefits:

- Effective for difficult conditions
- Alternative to surgery
- Fast treatment times
- Easy non-invasive treatment
- Scientifically proven treatment

Laser therapy treatments last between 5 and 10 minutes depending on the condition being treated. Laser therapy treatments must be administered directly to skin, as laser light cannot penetrate through layers of clothing. You will feel a soothing warmth as the therapy is administered.

Depending on the condition being treated your therapy may be administered through either a contact or non-contact hand piece. The contact hand piece is designed to allow the practitioner to physically manipulate the tissue while administering the treatment, resulting in a laser-massage treatment. This allows for light to penetrate deeper into tissues than the non-contact hand piece due to its ability to displace tissue through a laser-massage technique.

Patients generally see results after 3 to 5 treatments. Your doctor will develop a treatment plan that is optimal for your condition.
